

The solution of protecting campus

chapter1: If someone want to intrude campus.

It involves relational database and noSQL databse

Relational database: e.g. to storage the information of staff and students

noSQL: sensor, logs or other complex data

decision tree for chosen scenario

Data structure: table      relational database  
graph      noSQL database

Normalisation      relational database : easier to use, higher security

Storage requirements: include structured, semi-structured, unstructured data,  
e.g. image or information table

Scalability: sometimes have some requirement to optimise the robot, e.g.  
processing the terrain model(horizontal scaling noSQL)
